Engineering

Work Type

Onsite

At Netflix, our mission is to entertain the world. Together, we are writing the next episode - pushing the boundaries of storytelling, global fandom and making the unimaginable a reality. We are a dream team obsessed with the uncomfortable excitement of discovering what happens when you merge

creativity, intuition and cutting-edge technology. Come be a part of what's next.

Content and Business Products Engineering builds the products and services used by our internal and external creative partners producing and managing our global content. Our products enable the entire workflow of content production and promotion, from pitch to play, and provide innovative new ways to develop and manage entertainment at scale.

We are hiring for this role across the following Content and Business Products Engineering:

Content Infrastructure & Solutions (CIS)

This team builds platforms that empower CBP engineers to support Netflix's large-scale content production. We're hiring for the **Information Discovery – Search** team, which develops an internal search platform used across many enterprise applications. It combines robust backend services with intuitive tools, including **AI-driven chat interfaces**, **dynamic smart components**, and **semantic search** to understand the context of creative data. Search powers 100+ internal applications, nearly 200 indices, and thousands of users, supporting every stage of our content journey—from pitch to final delivery.

Studio Production Engineering

In this team, you will have a direct impact on how the Netflix studio creates and produces shows, such as “The Witcher”, “The Crown”, and “Stranger Things” on a global scale. With an increasing slate of original content being produced every year, our products manage billions of dollars worth of content spend.

Content Promotion & Distribution Engineering

This team directly impacts our business users and consumers by building products that allow us to manage our global entertainment catalog and next-generation off-service experiences.

Content Finance Engineering

This team builds products to help Netflix plan, spend and account for the money we spend producing world-class, award-winning, high quality, and diverse content. The goal of our team is to provide accurate planning of our content budget, help production houses manage their production budget, accounting of content spend and reduce the risks associated with reporting of the content spend.

This role is based in Warsaw, and our teams work in a hybrid-working model.

Your Day-to-Day:

- Work cross-functionally to build, test, deploy, and launch backend services that operationalize our workflows at scale.
- Participate in product reviews and team meetings, providing technical insight. Help scope, estimate, and prioritize between conflicting needs.
- Evaluate new technologies and approaches to streamline and improve our rapid application development tooling and conventions.
- Regularly learn and influence new systems and tools as the Netflix platform and ecosystem evolve.
- Participate in our on-call rotation and lead the incident reviews.
- Effectively communicate complex technical issues and solutions to stakeholders.
- Live company values, actively engage in team discussions and provide mentorship while holding the team accountable for collective standards.

You will enjoy working with us if you:

- Are passionate about building top-tier, robust, and scalable backend systems
- Love brainstorming with fellow backend and UI engineers, product designers, product managers, and directly with our users, to understand what they want, figure out what they really need, and finally, what we should build.
- Eager to identify business opportunities that positively impact the organization's bottom line.
- Enjoy working closely with business or engineering users to understand their needs, and how best to solve them.
- Strive to embrace best practices and are always searching for opportunities to continually improve.
- Are selfless and willing to flex across the stack or into a new domain to help a teammate when needed, never thinking “that’s someone else’s job”.

We would love to work with you if you:

- Have experience architecting, building, and operating resilient, highly-available, high-scale, low-latency microservices in production environments, with a proven track record of ensuring high availability, fault tolerance, and performance.
- Are proficient with gRPC, GraphQL, or RESTful API design and implementation, and relational and non-relational data stores.
- Have recent, proficient experience with Java, C#, or other OO programming languages with a solid understanding of OO design principles, concurrency, multi-threading, performance tuning, and observability.
- Have the ability to proactively describe complex technical concepts to a variety of stakeholders, driving conversations and decisions through written and/or verbal communication.
- Have a strong sense of ownership, independence, bias towards action, and inclination for collaboration.
- Are able to recognize, communicate, address and lead the technical improvements as part of the roadmap.

You will stand out as a candidate if you:

Have some of the experience below. These aren't must-haves, but certain teams prefer them, and they can help you fit better in specific roles:

- Enjoy working closely with UI engineers, UX designers, and product managers to deliver reliable and performant services that meet user needs.
- Have experience working full stack, with skills in frontend and backend development, and you are open to diving into both areas when necessary.
- Have experience creating platforms, tools, or infrastructure for engineers, with a focus on understanding their needs and designing long-term solutions.
- Have experience in storage or media processing domains, in observability platforms, or you worked with or as SREs.
- Have experience developing build tooling, delivery automation, and self-service infrastructure tools.
- Have experience building software and distributed systems for media production and/or distribution workflows is strongly desired.
